TITLE: A device for simultaneously flash welding edge joints by using high frequency currents. Class 21, No. 179858 [announced by All-Union Scientific Research Institute of Electric Welding Equipment (Vsesoyuznyy nauchno-issledovatel'skiy institut elektrosvarochnogo oborudovaniya)]

SOURCE: Izobreneniya, promyshlennyye obraztsy, tovarnyye znaki, no. 6, 1966, 53-54

TOPIC TAGS: flash welding, seam welding, automatic welding, welding equipment

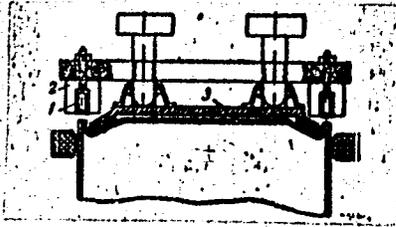

ABSTRACT: This Author's Certificate introduces a device for simultaneously flash welding edge joints by using high frequency currents. The unit contains an inductor located above the ends of the crimped edges and a high-frequency generator supply unit. High quality welding of weakly crimped edges is provided by making the inductor in the form of a coil with a configuration which conforms to the perimeter of the components to be welded. This coil is surrounded by a ferrite core with electromagnetic screens at points not subjected to welding. The power supply for the high-voltage generator.

TITLE: Production of thin-walled products from a melt with air blowing 14

SOURCE: IVUZ. Tsvetnaya metallurgiya, no. 3, 1966, 138-143

TOPIC TAGS: molten metal, metal drawing, metallurgic process, cooling

ABSTRACT: A method for the uniform cooling of products by blowing with air is examined. A cooler which provides a high value of the heat-transfer coefficient at a small distance from the crystallization front is described. In this device a stream of air is directed through a blowing slot to the surface of the product and is deflected by it upward and partially downward. Downward blowing depends upon the distance and shape of the edge of the blowing slot; it should not be appreciable since a strong air stream deforms the meniscus of the melt and lowers the temperature of the mold. A strip of the product 5--10 mm wide is under the effect of a normal air flow and adjacent parts of the surface are under the effect of a tangential flow. Various types of coolers are used for cooling products of a complex shape. The velocity of the air flow

Card 1/2

L 40235-66

ACC NR: AP6010647

at the output from the blowing slot when drawing articles is usually several tens of meters per second. At such velocities and normal incidents of the flow on a narrow section of the surface, high values of the heat-transfer coefficient are achieved. The dependence of the thickness of the product on the cooling conditions was investigated by drawing sheets, tubes, and complex shapes. The main method of increasing the drawing rate is to bring the cooling zone closer to the crystallization front even if this means reducing the heat-transfer coefficient. The presence of a buffer zone increases the dependence of thickness on the drawing rate. Orig. art. has: 1 table, 5 figures, and 4 formulas.

TITLE: Thermal conditions for producing thin-walled products from a melt

SOURCE: IVUZ. Tsvetnaya metallurgiya, no. 2, 1966. 154-161

TOPIC TAGS: metal casting, convective heat transfer, thermal analysis, temperature distribution, optimization

ABSTRACT: Thermal conditions and process parameters for the continuous casting of thin-walled products from a melt are given. Four cooling methods are described: 1) drawing from a melt with the crystal front sliding across water-cooled metal shoes; 2) convective cooling in a liquid; 3) convective cooling in a liquid without a buffer zone; 4) by air-blast or water spraying. For method (1) so much friction results from the ingot-wall interface that wall thicknesses must be maintained above 5 mm. Heat conduction coefficients varied from 1000 kcal/m<sup>2</sup>-deg-hr for (1) to 2000-10,000 kcal/m<sup>2</sup>-deg-hr for (4). The temperature was given as a function of  $x$ --the vertical coordinate, by the equation

$$T = T_0 \exp \left[ \frac{c p v}{2\lambda} \left( 1 - \sqrt{1 + \frac{4\alpha\lambda}{lc^2 p^2 v^2}} \right) x \right],$$

UDC: 669.017: 621.77

Card 1/2

ACC NR: AP6023643

where  $c$  is specific heat,  $\rho$  is density,  $v$  is velocity,  $\lambda$  is thermal conductivity and  $\alpha$  is the surface coefficient. Casting thickness  $l$  is related to a group of heat transfer parameters which were listed for 25 metals and alloys. Values of  $l$  are given for 10 metals drawn from the melt at 10 m/hr for cooling by radiation and self convection ( $\alpha=100$  kcal/m<sup>2</sup>-deg-hr). The effect of the heat transfer rate in the liquid portion of the melt on thickness is also given. Nomographs are shown for determining the relation between strip thickness, gap width of molds and the extraction conditions. Data are presented for aluminum in which thickness is given as a function of  $v$ ,  $\alpha$  and  $\Delta T$ --the superheat--for different parameters and casting methods. For a particular thickness, the necessary gap width  $s_0$  was determined from  $s_0 = s \pm (0.1-0.2)$  mm, where  $s=2(l)$ . Orig. art. has: 6 figures, 4 tables, 9 formulas.

TITLE: Producing thin-walled flattened sheet pipe (radiator strip) directly from the melt

SOURCE: Ref. zh. Metallurgiya, Abs. 7D316

REF SOURCE: Uch. zap. Leningr. gos. ped. in-ta im. A. I. Gertsena, no. 365, 1965, 75-89

TOPIC TAGS: pipe, metal drawing, radiator pipe, flattened pipe

ABSTRACT: Metal drawing for radiator strip has been carried out on a laboratory unit. The strip was drawn from A Mts alloy. The type of equipment and some technological problems were developed and solved for producing 4-, 6- and 10-channel strip with a 0.3--1.0-mm gage. The production technology for a 13 channel strip is described. An experimental batch (~300 m) of radiator strip for two radiators of a tractor radiator was produced and analyzed. Semicontinuous and continuous units were designed for producing thin-walled flattened sheet pipes

TITLE: Frequency converter incorporating controlled silicon rectifiers

SOURCE: IVUZ. Elektromekhanika, no. 8, 1966, 888-892

TOPIC TAGS: frequency converter, electronic rectifier, electronic circuit

ABSTRACT: An approximate method for calculating a frequency converter of this kind is presented, for a converter circuit with the parametric ratios  $L_1/L_k = 2$ ,  $C_1/C = 0.5$ ,  $\omega/\omega_0 = 1.1$  for which the time interval assigned to the deionization rectifier is roughly twice as long as in circuits of autonomous inverters. In this circuit, trigger pulses are shifted  $180^\circ$  in phase and supplied to the rectifiers  $B_1B_4$  and  $B_2B_3$  with the circular frequency  $\omega$ . It is shown that the required power of the rectifier must be in agreement with the power lost in the tank circuit in order for the mathematical analysis to maximally approximate real processes in the frequency converter. The results of the mathematical analysis are verified with the aid of a model (2.5 kilo-ops, 5 kw) of a frequency converter incorporating VKU-100 type silicon rectifiers. Orig. art. has: 3 figures and 14 formulas. [JPRS: 38,694]

TITLE: High-frequency plasma devices

SOURCE: AN SSSR. Sibirskoye otdeleniye. Izvestiya. Seriya tekhnicheskikh nauk, no. 3, 1966, 73-80

TOPIC TAGS: plasma device, plasma discharge, high frequency discharge, *electric generator*

ABSTRACT: Various devices with high-frequency plasma discharges are discussed from the viewpoint of their energy characteristics, electric parameters, and structural design. In particular, a plasma burner of the capacitive (jet) type and a plasma burner of the inductive type are considered. A high-frequency generator (5-8 Mc and  $10^9-10^{10}$  cps) is used as a power supply source for the capacitive plasma burner. The current of the capacitive discharge may be increased by decreasing its reactance. The plasma discharge is usually surrounded by a grounded metallic cylinder. In order to avoid short-circuiting of the capacitive current on the cylinder, the flame of the jet discharge is enclosed in a quartz tube with a gas stream. When the diameter of the jet discharge channel is  $\sim 5$  mm, the smallest diameter of the outer cylindrical electrode should be 25-30 mm. Such a structure of the burner greatly increases the capacitance between the burner and ground, and decreases by an order of magnitude the

Card 1/2

UDC: 533.9.07

discharge impedance. The inductive plasma burner also uses a high-frequency generator as a power supply source. This type of burner is based on electrodeless inductive discharges excited by a variable magnetic field of the inductor. A comparison of the two plasma burner types has shown that the energy transfer to plasma is much more efficient in the inductive burner. Orig. art. has: 8 figures.

TITLE: Corrosion and oxidation resistant steel plates

SOURCE: Standarty i kachestvo, no. 10, 1966, 89-90

TOPIC TAGS: corrosion resistant steel, oxidation resistant steel, stainless steel, metal oxidation, metal test, metallurgic process, steel microstructure, scientific standard

ABSTRACT: GOST 7350-66 for corrosion and oxidation-resistant stainless plate steel has been collated at the Central Scientific Research Institute of Ferrous Metallurgy to replace GOST 7350-55. In the new GOST, the number of steel types was increased from 15 to 35 and the range of available plate thickness was expanded from 25 mm to 50 mm. Four groups of surface finish are specified, among them an AA group with a polished surface. Specifications for waviness and camber-tolerances are made more rigid. The requirements for microstructure and intercrystalline corrosion tests are specified. Higher mechanical properties are required. The yield strength and impact toughness values for some steels are

1/2

ACC NR: AP6035811

specified. On special request some specific and technological properties, such as content of  $\alpha$ -phase, heat-resistance, and the content of non-metallic impurities, are provided. The sections on test methods and packaging, marking and documentation are expanded and made more precise.

TITLE: Steel strip in coils

SOURCE: Standarty i kachestvo, no. 10, 1966, 90

TOPIC TAGS: carbon steel ~~scientific standard, strip metal~~, fabricated structural metal

ABSTRACT: GOST 1530-66, effective 1 January 1967, applies to hot rolled high-grade structural carbon-steel strip in coils. The GOST has been collated at the TsNIICHM to replace GOST 1530-42. In the new GOST, the range of available strip thicknesses is 1.5-10 mm in widths from 100 to 1700 mm; the strip is supplied with either trimmed or as-rolled edges. The tolerance for strip thickness is limited to 0.1 mm. The number of steel types was increased; semikilled steels with increased manganese content are included in the new GOST. The GOST also includes strips with reduced carbon, sulfur and phosphorus content intended for cold-rolled strips used in the electronic industry. The strip can be supplied in heat-treated and pickled condition. The permissible decarburization, depending on strip thickness, and the requirements to macro- and microstructure and mechanical properties are specified. Sections on test methods and packing and marking instructions are expanded and made more specific.

TITLE: Investigation of the steady flow of a weakly ionized plasma in the homo-  
polar device

SOURCE: Zhurnal tekhnicheskoy fiziki, v.35, no.1, 1965, 84-93

TOPIC TAGS: plasma, magnetohydrodynamics, steady flow, electric field, magnetic field

ABSTRACT: The authors have measured the radial pressure drop and velocity profile in a mass of rotating plasma confined between two coaxial cylindrical electrodes in a longitudinal magnetic field. The radii of the water cooled aluminum electrodes were 3.4 and 9.8 cm, and the annular region occupied by the plasma was bounded axially by two dielectric walls 3.6 cm apart. The plasma was formed by electric breakdown of the gas (usually air at a pressure between 0.125 and 1.0 torr) and was caused to rotate by the magnetohydrodynamic force due to the interaction of the radial current with the longitudinal magnetic field. Magnetic fields up to 5500 Oe were employed. The temperature of the plasma was estimated to be 700°K. The pres-

Card 1/3

ACCESSION NR: AP5003240

0

sure drop between the outer and inner electrodes was measured with an inclined oil manometer and the velocity profile was determined by measuring the viscous drag on 0.5 cm diameter spheres. Both the pressure drop and the radial distribution of azimuthal velocity was found to depend markedly on the polarity of the electrodes. When the inner electrode was the cathode the pressure drop was much less than with the opposite polarity; in some cases it even became negative, the pressure at the inner electrode then being greater than at the outer. The velocity profile was more sharply peaked in this case (inner electrode the cathode) and the maximum velocity occurred at a smaller radius. The possible origin of the polarity sensitive body forces responsible for this behavior is discussed and it is concluded that they are principally due to the "ionic wind" effect previously discussed by the authors and Ye.V.Nazarov (ZhTF 33,1328,1963), which arises from the fact that the magnetic field hinders the motion of the electrons parallel to the electric field more than it does that of the ions. The stability of the flow was investigated and it is concluded that the flow was laminar in most of the experiments. When the gas pressure was sufficiently increased, instability set in, as evinced by fluctuating forces on the probe sphere. This is ascribed to "destruction of the symmetry of the electric and hydrodynamic parameters of the system with respect to the central plane of

Card 2/3

L 27600-68

ACCESSION NR: AP5003240

the chamber as a consequence of the inhomogeneity of the magnetic field." When the gas pressure was sufficiently reduced the potential on the electrodes suddenly increased or the current decreased. The cause of this instability is obscure. "The authors express their gratitude to Prof. Yu. A. Izmayev for his constant interest and valuable discussions of the work." TITLE: Measurement of the electric field strength in the homopolar device

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 8, 1966, 1501-1506

TOPIC TAGS: gas discharge plasma, magnetic field, electric field, air, hydrogen, argon

ABSTRACT: The authors have measured the electric field strength in a homopolar device consisting of two 7.8 cm long, 6.8 and 19.6 cm diameter coaxial cylindrical electrodes mounted in the 7.8 cm gap between 29.5 cm diameter pole pieces with 5.2 cm diameter openings. The axial magnetic field (up to 2.5 kOe) was uniform within 2% throughout the working volume. The device contained air, hydrogen, or argon at pressures from 0.125 to 1.0 mm Hg. The electric field strengths were measured with a double probe consisting of two 0.2 mm diameter 3-4 mm long platinum wires mounted 4-6 mm apart. The electric field strength was not at all inversely proportional to the distance from the axis, as it would be if the resistivity of the medium were constant, but tended to increase toward the anode. As a rough approximation, especially in the case of negative polarity, the electric field could be regarded as constant within the volume of the device, and equal to its value at the mean radius. Except in hydrogen at high

Card 1/2

UDC: 537.525.1

L 45981-66

ACC NR: AP6028627

magnetic field strengths, the electric field strength was proportional to the magnetic field strength. The electrode potential drops were determined by measuring the potential difference between the electrode concerned and one of the probe wires, positioned 3 mm from it. Both the anode and cathode drops increased with increasing magnetic field strength, but the authors are unable to draw any definite conclusions concerning the effect of the magnetic field on the thickness of the region in which the electrode drops take place. Randomly appearing cathode spots were nearly always visible. In hydrogen the cathode drop increased more rapidly with increasing magnetic field strength in magnetic fields stronger than 1 kOe than in weaker fields. This behavior is tentatively ascribed to disruption of the oxide film on the electrode by higher energy hydrogen ions, which facilitates field emission of electrons. Orig. art. has: 3 figures.

TITLE: The influence of Mexamine on the course of systemic reaction in patients undergoing radiation therapy

SOURCE: Meditsinskaya radiologiya, no. 5, 1964, 15-20

TOPIC TAGS: systemic radiation reaction, 5 methoxytryptamine HCl, radiation reaction preventive, mexamine, serotonin, telegammatherapy, side effect, radiation therapy, radiation reaction therapeutic

ABSTRACT: The compound, 5-methoxytryptamine HCl, had been tried in laboratory animals and recommended by the pharmacological committee of the Ministry of Health, SSSR in 1962, as a preventive against radiation sickness. It resembles serotonin in its effect, but is less active and less toxic. Mexamine underwent clinical trial in 45 cancer patients undergoing telegamma therapy which amounted to a radiation total of 5000 to over 15,000 r. It was administered orally as a 50 mg tablet to 20 patients prophylactically, and to 25 therapeutically, 20-30 minutes before each treatment. In the latter patients radiation sickness symptoms disappeared

Card 1/2

ACCESSION NR: AP4038938

completely in 14 and decreased in 8. Mexamine treatment was stopped in 3 because of side effects. Out of the 20 patients who received Mexamine preventively, 10 completed their course of treatment without symptoms of radiation sickness, 4 had slight symptoms, and 6 could not tolerate Mexamine. The systemic protective effect was seen mainly in those clinical cases where reaction to irradiation was less pronounced. No effect was seen on the course of local tissue reaction. Although side effects (nausea, vomiting, headaches, diarrhea, etc.) required interruption of treatment in 20% of the patients, the product may still be considered a valuable means of controlling systemic radiation reaction. Orig. art. has: 3 tables.

PERIODICAL: Tsvetnyye Metally, 1959, Nr 1, pp 94-96 (USSR)

ABSTRACT: The authors list the defects of stripping copper base sheets on horizontal tables. They describe a machine (Fig 1) for stripping in a vertical position, designed by N.B. Babitskiy, V.V. Bure and O.V. Donskoy which has been successfully applied at the Noril'sk combine and discuss the resultant improvements in labour productivity. They suggest that other Soviet copper electrolytic works should consider adopting such machines.

TITLE: Effect of electrohydraulic finishing on the tendency of intergranular corrosion of steel pipes toward intergranular corrosion

SOURCE: Avtomaticheskaya svarka, no. 7, 1964, 19-81

TOPIC TAGS: electrohydraulic finishing, chromium steel, intergranular corrosion, welding, weld surface finishing, milling, heat treating, metal electropolishing, microstructure

ABSTRACT: It was found that finishing the external surface of welds by the electrohydraulic method reduced the intergranular corrosion of the welded pipes as tested by the M and D (ISO 6032-58) methods. The method used has been described by A. L. Vishnitskiy (Nauka v ramery elektrotekhnicheskoy metalloobrabotki, 1962). In this electrohydraulic method the pipe is passed through a mounted multistage cathode at a speed as high as 2 m/min.; and the outer layer of the weld is removed at a high current density in conjunction with a high rate of

L 8636.65

ACCESSION NR: AP404163

electrolysis. Comparative tests between the electrohydraulic removal and milling (with a hard-wire brush) of the welded seams were run on OKh1210T steel pipes prepared for the AM test by annealing at 1050 for 10 min, followed by quenching and holding at 501 for 2 hours, and for the D test by annealing at 1050 and 1100 for 10 min, followed by quenching. The microstructure of the surface of the milled welds showed ruptures and physical defects which tend toward intergranular corrosion. Electrohydraulic treatment eliminated these defects leaving a smooth clean surface. In the AM test, when the Ti/C ratio in the weld after heat treatment was 4, no corrosion was observed. In the D test the corrosion rate of the metal annealed at 1100 was about the same in the first cycle for the milled and the electrohydraulically finished pipes, and was progressively increased in the second and third cycles in the milled pipes; the corrosion rate of the metal annealed at 1100 and subjected to the electrohydraulic finishing was about one-half that of the milled pipes. Orig. art. has 3 tables and 4 figures.

TITLE: Electrochemical method for pipe reconditioning. Class 48, No. 180053  
[announced by the Scientific Research Pipe Institute (Nauchno-issledovatel'skiy Trubnyy Institut)]

18

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 6, 1966, 119

TOPIC TAGS: pipe, pipe reconditioning, SODIUM CHLORIDE, AUSTENITIC STEEL

ABSTRACT: This Author Certificate introduces an electrochemical method for reconditioning austenitic steel pipe with a solution of sodium chloride. For longer service life the initial pipe is surface treated in a flow-through electrolyte at -8 to +10C with current density of 10 amp/cm<sup>2</sup> and higher. [LD]

TITLE: On the Problem of Investigating the Modulus of Elasticity and  
Internal Friction in Metals

PERIODICAL: "Uch. zap. Sev-Osetinsk. gos. ped. in-t", 1958, Vol. 23, No. 1,  
pp. 33-46

TEXT: Measurements were made of the dynamic modulus of elasticity E and  
internal friction on steel, Fe, Cu, brass, Al and Bi specimens, using the radio-  
engineering method. It was established that preliminary plastic deformation in-  
creased the magnitudes of A and internal friction; subsequent aging at room  
temperature and annealing reduced the magnitude of these values; whereby inter-  
nal friction magnitude proved to be affected more. These phenomena are explain-  
ed by the metastability of the metal and its tendency of passing into a stable  
state during aging and annealing. There are 35 references. P. Z.

TITLE: A Conference on Riverbed Processes and Hydro-Construction Projects  
(Soveshchaniye po ruslovym protsessam i gidrotekhnicheskomu stroitel'stvu)

PERIODICAL: Izv. AN UzSSS (Bulletin of the Academy of Sciences, Uzbek SSR),  
1956, Nr 5, pp 96-97

ABSTRACT: At the broad conference which took place at Tashkent (the conference organized by the Section of Scientific Research Into the Problems of Water Culture, AS USSR, together with the Section of Engineering Geological and Chemical Sciences, AS Uzbek SSR), principal lines in the development of the theory of riverbed processes were revealed and the most important tasks of the scientific and engineering organizations in the Central-Asian Republics and Kazakhstan were mapped out. The following are recommended in the field of theory and in methods of calculating riverbed processes: (1) study of the general laws of riverbed processes and the methods of their prediction; (2) methods of calculating riverbed reformations used in construction and

operation of hydropower development. The following research findings in the field of construction and operation of engineering installations are recommended: (1) curvilinear sumps developed by SANIIRI; (2) prefabricated steel-concrete shore-protective structures; (3) a certain method of pump flushing at hydropower installations and at the head sections of canals. Singled out were the problems of water culture that should constitute the principal task of scientific and design organizations of the Central-Asian Republics and Kazakhstan, particularly a radical improvement of the complex utilization of water resources. The need for the following developments was noted: further development of the network of hydrometeorological stations at riverbeds and water reservoirs; organization of wider research into hydraulics of saline streams; expansion of research programs at the Institutes of Academy of Sciences of Soyuz Republics, including the problems of riverbed processes; further development of new methods of investigation and new equipment; improvement and expansion of publications of the Institutes; strengthening of their material and technical basis; expansion of "Gidrotekhnika i melioratsiya" and "Gidrotekhnicheskoye stroitel'stvo" journals, etc.
